At /admin/admin.php I found an admin panel that had all user passwords as well as forms to change user password and remove users.

I however was not able to change the password of the andy[at]culler[.]com using this form in any way.

The form posts to /admin/adduser.php taking a username and password field. I tried first by submitting the form to my own account. I then tried to do the same by logging into those same users and then submitting the same requests. Afterward I tried using burp suite and editing the response and was getting an Invalid Session response. This led me to think there is some issue with the user I was using and I tried the most of the earliest users with no prevail. I am unsure on how exactly to change the password, I tried plenty of other ways of submitting the request not limited to python requests, js console requests, and editing requests in the inspect element console.
